Re: Software Engineer / AI Automation Specialist

Dear Hiring Manager,

I'm a self-taught software engineer who builds production systems end to end, and then finds the manual work around them that should be running on its own. I'd like to bring that to your team.

In 2026 I shipped ten projects with more than 550 commits. At MMCY Tech I built Derash, a shuttle-management platform for the company's employee transport. It has a routing engine that clusters riders and plans trips, a scheduler that runs every shift end automatically, live GPS tracking, and Flutter apps for riders and drivers. I also built a browser extension my team uses every day. It turns a fifteen-click call-center workflow into one click.

On the Gebeta Gaming Platform, my iGaming work across four codebases, I built real-time multiplayer games on Socket.io, a wallet with a double-entry ledger that prevents double-spending, and an Android app that reads payment SMS so deposits are verified without a person checking each one.

I work AI-native. I write the spec, direct AI coding agents like Claude Code in small steps, review every change, and back it with tests: more than 175 test files across my repositories. I also spent two years in sales and operations, so I start from the problem people actually have, and I can explain what I build to the people who use it.

You can see my projects at samuel-erkuye-dev.vercel.app and my code at github.com/JagemaK. I'd welcome the chance to talk about what your team would like automated first.

Best regards,
Samuel Mekonnen Erkuye
